Code for Figure S5

September 1, 2016

Load the necessary libraries, source the file with the R functions:

```
library(ggplot2)

source("functions.R")
```

Will use the same theme throughout, so just declare this variable:

```
themeUsed <- theme_bw(base_size = 20) +
  theme(axis.line = element_line(colour = "black"),
        plot.title = element_text(size = 15, hjust=0.5),
        panel.grid.major = element_blank(),
        panel.grid.minor = element_blank(),
        panel.border = element_blank(),
        panel.background = element_blank(),
        legend.background = element_rect(fill="transparent"),
        legend.key = element_blank(),
        legend.text.align = 0,
        legend.position = c(0.15,0.28),
        axis.line.x = element_line(color="black", size = 0.5), ##this is to show axes - bug in this vers
        axis.line.y = element_line(color="black", size = 0.5))
```

1 Panel a)

Get what is needed for panel a): Load the files representing the summary for each scenario with 0 heterogeneity and save the results in a single dataframe, Vars0:

```
allFiles <- list.files("simResultsComb")
##remove files that have "bd_het" in the title
allFiles <- allFiles[-grep("bd_het", allFiles)]

##save the three Vars for the different combinations
VarsAll <- expand.grid(I = c(5, 10, 15, 20),
                       p = 2:10,
                       corrBtw = c(0,0.5),
                       varBtw = c(0, 1))

##only keep combinations of corrBtw=0 & varBtw=0, corrBtw=0.5 & varBtw=1
VarsAll <- VarsAll[(VarsAll$corrBtw == 0 & VarsAll$varBtw == 0) |
                   (VarsAll$corrBtw == 0.5 & VarsAll$varBtw == 1) ,]
```

```
VarsAll$known <- VarsAll$unknown <- VarsAll$univKnown <- VarsAll$univ <-
  VarsAll$Bayes <- VarsAll$univBayes <- NA

for(file in 1:length(allFiles))
{
    load(paste("simResultsComb",
               allFiles[file], sep="/"))

    rowNr <- gsub("combine_cost_of_estimation_", "", allFiles[file])
    rowNr <- gsub(".RData", "", rowNr)
    rowNr <- as.numeric(rowNr)

    VarsAll[rowNr, colnames(VarsAll)] <- Vars[rowNr, colnames(VarsAll)]
}
VarsAll$Ratio <- VarsAll$known/VarsAll$unknown
VarsAll$RelEff <- VarsAll$unknown/VarsAll$univ
VarsAll$RelEffT <- VarsAll$known/VarsAll$univKnown
VarsAll$RelEffB <- VarsAll$Bayes/VarsAll$univBayes
VarsAll$MVMAcomp <- VarsAll$unknown/VarsAll$Bayes
range(VarsAll$Ratio)

## [1] 0.8381268 0.9947634

##only keep the ones with varBtw = 0 and I=20
Vars0 <- VarsAll[VarsAll$varBtw == 0 & VarsAll$I == 20 ,]
```

Load the files representing the summary for each scenario with non-0 heterogeneity and save the results in a single dataframe, VarsAll:

```
allFiles <- list.files("simResultsComb")
##keep only files that have "bd_het" in the title
allFiles <- allFiles[grep("bd_het", allFiles)]

##save the three Vars for the different combinations
VarsAll <- expand.grid(I = 20,
                       p = 2:10,
                       corrBtw = c(0.5),
                       varBtw = c(1/5, 1, 5))

VarsAll$known <- VarsAll$unknown <- VarsAll$univKnown <- VarsAll$univ <-
  VarsAll$Bayes <- VarsAll$univBayes <- NA

for(file in 1:length(allFiles))
{
    load(paste("simResultsComb", allFiles[file], sep="/"))

    rowNr <- gsub("combine_cost_of_estimation_bd_het_", "", allFiles[file])
    rowNr <- gsub(".RData", "", rowNr)
    rowNr <- as.numeric(rowNr)

    VarsAll[rowNr, colnames(VarsAll)] <- Vars[rowNr, colnames(VarsAll)]
}
VarsAll$Ratio <- VarsAll$known/VarsAll$unknown
VarsAll$RelEff <- VarsAll$unknown/VarsAll$univ
```

```
VarsAll$RelEffT <- VarsAll$known/VarsAll$univKnown
VarsAll$RelEffB <- VarsAll$Bayes/VarsAll$univBayes
VarsAll$MVMAcomp <- VarsAll$unknown/VarsAll$Bayes
range(VarsAll$Ratio)

## [1] 0.9523564 0.9996242
```

Separate out what is needed for Panel a):
